Preface

In This Chapter

Documentation Conventions

Before you start using this guide, it is important to understand the documentation conventions used in it.

Typographical Conventions

The following kinds of formatting in the text identify special information.

Formatting convention	Type of Information	Example
Special Bold	Items you must select, such as menu options, command buttons, or items in a list.	Navigate to the **QoS** tab.
	Titles of modules, sections, and subsections.	Read the **Basic Administration** module.

Italics	Used to emphasize the importance of a point, to introduce a term or to designate a command line placeholder, which is to be replaced with a real name or value.	These are the so-called *shared VEs*. To destroy a VE, type `vzctl destroy VEid`.
Important	An important note provides information that is essential to the completion of a task. Users can disregard information in a note and still complete a task, but they should not disregard an important note.	**Important**: The device drivers installed automatically during Setup are required by your system. If you remove one of these drivers, your system may not work properly.
Note	A note with the heading "Note" indicates neutral or positive information that emphasizes or supplements important points of the main text. A note supplies information that may apply only in special cases—for example, memory limitations, equipment configurations, or details that apply to specific versions of a program.	**Note**: If Windows prompts you for a network password at startup, your network is already set up and you can skip this section.
`Monospace`	The names of commands, files, and directories.	Use `vzctl start` to start a VE.
`Preformatted`	On-screen computer output in your command-line sessions; source code in XML, C++, or other programming languages.	`Saved parameters for VE 101`
`Preformatted Bold`	What you type, contrasted with on-screen computer output.	**`# rpm –V virtuozzo-release`**
CAPITALS	Names of keys on the keyboard.	SHIFT, CTRL, ALT
KEY+KEY	Key combinations for which the user must press and hold down one key and then press another.	CTRL+P, ALT+F4

General Conventions

Be aware of the following conventions used in this book.

* Modules in this guide are divided into sections, which, in turn, are subdivided into subsections. For example, **Documentation Conventions** is a section, and **General Conventions** is a subsection.

* When following steps or using examples, be sure to type double-quotes ("), left single-quotes (), and right single-quotes (') exactly as shown.

* The key referred to as RETURN is labeled ENTER on some keyboards.

Commands in the directories included into the PATH variable are used without absolute path names. Steps that use commands in other, less common, directories show the absolute paths in the examples.

Feedback

If you have found a mistake in this guide, or if you have suggestions or ideas on how to improve this guide, please send your feedback using the online form at http://www.parallels.com/en/support/usersdoc/. Please include in your report the guide's title, chapter and section titles, and the fragment of text in which you have found an error.

Understanding POA Privileges Management Concept

In This Chapter

Understanding Concept of Roles

Security Model

POA gives various users the abilities to perform various operations with system objects. The system of *Roles* and *Privileges* is the mechanism that is used to manage and control the provision of such abilities.

Each operation involves certain objects. So the logical way of allowing users to do something is to require users to have specific permissions to perform certain operations on the involved objects. For example, in order to be able to create a new domain the user has to be given the necessary permissions, including the permission to create domains.

There are basic security notions you must be familiar with when dealing with permissions and operations:

1 *Account* is the basic security notion as all operations being performed within the system are connected with different accounts. The types of accounts in POA are:

   • *Provider Account.* A Provider is able to create reseller and customer accounts subscribing them to Service Templates and giving them privileges to perform operations in POA.

   • *Reseller Accounts*. A Reseller can add and manage his/her own Reseller and Customer Accounts that would form a subordinate hierarchy of Accounts toward the "top" Reseller Account.

   • *Customer Accounts*. A Customer can only add the Staff Member accounts.

2 *Privilege* is a named permission to execute certain operations on certain objects. For example, the *Domains Management* privilege allows for creating and managing domains. Privileges are defined system-wide at POA initial installation or upgrade and cannot be modified.

3 *Role* is a set of privileges. Its purpose is the grouping of privileges and assigning them to different users. One Role can be assigned to several users and several Roles can be assigned to the same user simultaneously. If a Role is modified, all the users assigned this Role are influenced correspondingly at the same time.

> **Note:** After a user's Role is modified, changes take effect only upon his or her next login to POA.

Concept of Privileges

Privilege is a permission to perform a certain operation, or a set of operations. The entire set of operations define all capabilities of POA and are created during initial installation, upgrade or component addition.

Privileges are created and mapped to operations by POA components during component installation. Also the area of applicability for each privilege (types of users that can have privilege) is defined during component installation. The following areas of privileges' applicability are distinguished:

- Providers' privileges,

- Resellers' privileges,

- Customers' privileges.

Privileges are used through *Roles.* No newly created privilege belongs to any Role until it is explicitly added for it.

> **Note:** The exception is the Role Administrator created when POA is installed for the Provider. All the available privileges are automatically added to it, and all new privileges that appear in the system are also automatically added to it at the moment of their appearance in the system.

Concept of Roles

The system of Roles is a common concept used in the permissions systems. It is a convenient mechanism of administering user's abilities within the system. By assigning Roles to user or revoking Roles from him/her, one can change the set of operations available to the user or, in other words, manage user's permissions.

A Role is a set of *privileges* and is used for providing users with the permissions for operations on objects defined by these privileges. A Role also has two editable attributes: *name* and *description*.

> **Note:** Any user can have multiple Roles. Any Role can be assigned to multiple users. The resulting privileges the user gets is a combination of all privileges defined by all Roles assigned to the user.

The concept of Role is used in POA for the same purposes; however the exact definition of Role may be different for other systems.

Our definition of Role: *Role is the set of privileges*.

There are two ways for the Role to appear in the system:

- The Role is created manually by the user (any user of any type is capable of creating Roles, unless it is specifically explicitly forbidden for this given user).

- Whenever there is a new account added in the system, a default *Administrator* Role for this account is assigned automatically. Such Roles are defined for all newly created accounts and assigned to the account Staff Member created with the account, this Staff Member gets all the privileges defined by the Administrator Role.

Roles are created for particular types of accounts. This is due to the fact that different sets of privileges are applicable for different types of accounts.

What is Administrator Role

The *Account Administrator* Role should be mentioned separately from other Roles. As was mentioned earlier, this Role is created and automatically assigned to the first Staff Member of the newly created account.

The Account Administrator Role is defined by user for types of accounts he/she can create and is supposed to provide the new account Staff Member with all the privileges applicable for this type of account. Its purpose is to immediately enable the first created Staff Member to perform all required functions, like setting up other Staff Members, etc.

> **Note:** Staff Members eventually created for the account are not assigned the Account Administrator Role automatically.

Understanding Hierarchy of Accounts and Users

What is Account

Account is a POA object.

All users working with POA are represented by *Accounts* and all operations being performed within the system by a user is performed on behalf of a certain account.

At the same time, an account is rather an abstract notion, meaning a record of a company that works with POA; such record contains the general and contact information.

Staff Members

Staff Members are active users of the system. A Staff Member represents a certain company that is registered in POA as a Provider, reseller or customer.

All operations on behalf of an account are physically performed by a Staff Member. When you create a new account in POA, you simultaneously create the first Staff Member for this account. More Staff Members can be added to an account later, if there is a need to share the scope of work between several Staff Members of one account.

Types of Accounts

Accounts in POA can be of the following types:

- *Provider* – the owner of hosts or various services installed on hosts that he/she provides to Resellers and Customers.

14

- *Reseller* – the mediator between the Provider and Customers. The Reseller can add and then manage his/her own Reseller and Customer accounts. These accounts form a hierarchy of accounts that is subordinate toward the "top" Reseller account.

- *Customer* – the end-user of resources provided.

Managing Reseller Accounts

When working with users, the primary function of the provider is managing the first-level resellers. The provider is able to create and manage resellers, assign system resources to them so that resellers are able to perform their functions i.e. distributing the system resources further, to customers and/or the resellers of lower levels.

When a first-level reseller and a corresponding account is created, the provider uses the various means provided by the system (e.g. Roles and Privileges) to define the specific part of the system, which a given reseller will be responsible for – where he/she will have the necessary powers to manage the system objects. Acting on behalf of this reseller, the provider can also create resellers of lower levels that will be subordinate to the given reseller but that is not the provider's primary function.

Managing Customer Accounts

A customer is the system's end-user, the end-user of its resources. As a reseller, you can create and manage customers directly.

A customer's account consists of two basic pieces of information: company information and information on a Staff Member, representing this company. In other words, a customer is not an active user of the system, but this is some system object that represents a company, which consumes the provided hosting services. Physically, a customer interacts via its Staff Member(s) (users).

Managing Staff Members

Staff Members are active users of the system; they are created for a particular user of one of the three regular types, i.e. provider, reseller or customer.

A Staff Member represents a certain company that is registered in POA as reseller or customer, and is actually the one who performs certain operations in POA within the limits of his/her assigned privileges. There can be several Staff Members for each reseller or customer.

A provider can also create one or several Staff Members and grant them the same (or lesser) capabilities as the provider has, sharing this way the provider's responsibilities among several people who will work all on behalf of the provider. The provider can create Staff Members for him/herself as well as for other users (resellers and customers).

Provider Staff Member's Privileges

There are the following Provider Staff Member's privileges:

Application Hosting

- Application Users (on page 41)
- APS Packages (on page 42)
- Web Applications Management (on page 199)
- Web Applications Management (for provider) (on page 201)
- Backups Management (on page 44)
- Own Applications (on page 131)

Dedicated Hosting

- Customer Dedicated Servers (on page 61)
- Dedicated Servers Management (on page 66)
- Dedicated Servers OS Images (on page 67)

Linux Mail Hosting

- AntiSpam Management (on page 39)
- AntiVirus Management (on page 40)
- E-Mail Administration (on page 72)
- Maillists (on page 111)
- Backups Management (on page 44)

Linux Shared Hosting

- Apache Configuration (on page 41)
- Crontabs Management (on page 55)
- Databases Management (on page 64)

- Logfiles Access (on page 109)
- Own Websites (on page 155)
- Scheduled Applications Management (on page 171)
- SiteBuilder
- Configuring External CMS (on page 49)
- Content Management Systems (on page 50)
- Web Statistics Access (on page 202)
- Website Administration (on page 204)
- Websites (on page 208)
- Webspace Access (on page 208)
- Backups Management (on page 44)

Windows Shared Hosting

- Databases Management (on page 64)
- IIS Configuration (on page 99)
- ODBC DSN Management (on page 118)
- Own Websites (on page 155)
- Configuring External CMS (on page 49)
- Content Management Systems (on page 50)
- Streaming Media Configuration (on page 184)
- Web Statistics Access (on page 202)
- Website Administration (on page 204)
- Websites (on page 208)
- Webspace Access (on page 208)
- Backups Management (on page 44)

Hosted Exchange

- E-Mail Administration (on page 72)
- Exchange Domain Configuration (on page 79)
- Exchange Mailbox Templates Administration (on page 81)
- Exchange Public Folder Stores Replicas Administration (on page 82)
- Exchange Company Disclaimers Administration (on page 83)

- Exchange Resource Mailbox Administration (on page 85)
- Exchange Unified Messaging Administration (on page 86)
- Global Relay Archiving Management (on page 87)
- MessageLabs Management (on page 113)
- MX Logic Configuration Management (on page 114)
- MX Logic E-mail Security Administration (on page 114)
- Postini Management (on page 158)
- SPLA Reports (on page 183)
- Wireless Services (on page 211)
- Wireless Services Administration (on page 212)

Hosted Dynamics CRM

- CRM Administration (on page 52)
- SPLA Reports (on page 183)

Hosted OCS

- Office Communications Management (on page 120)
- Office Communications Meeting Policies Administration (on page 122)
- Office Communications Pools Administration (on page 123)
- Office Communications Phone Numbers Administration (on page 123)
- Office Communications User Profiles Administration (on page 126)
- Office Communications Users Administration (on page 127)

VPS Hosting and Parallels Plesk Panel in VPS Hosting

- All VPSs (on page 35)
- Backups Configuration Management (on page 43)
- Own VPSs (on page 151)
- Setup VPS Hosting (on page 182)
- VZ Templates (on page 197)
- Backups Management (on page 44)

Customer Directory Integration Privileges

- Customer Directory Integration Administration (on page 59)
- Customer Directory Integration Synchronization (on page 61)

System and Miscellaneous Privileges

- All Domains (on page 28)
- All Logins History (on page 31)
- All Users (on page 33)
- Backups Management (on page 44)
- Billing Access (on page 45)
- Broadcast Messages
- Branding Configuration (on page 46)
- Customer Accounts (on page 56)
- Customer's CP Access (on page 63)
- DNS Configuration (on page 69)
- Events (on page 77)
- Events Log Configuration (on page 79)
- Hardware Nodes (on page 89)
- Hosting Services Configuration (on page 93)
- Infrastructure Configuration (on page 100)
- IP Pools & Addresses (on page 103)
- Licenses (on page 108)
- Login as to MyCP (on page 111)
- News (on page 115)
- Own Account Info (on page 129)
- Own CP Access (on page 132)
- Own Customer's CP Access (on page 132)
- Own Domains (on page 134)
- Own Login History (on page 138)
- Own Reseller's CP Access (on page 140)
- Own Security Configuration (on page 141)
- Own User (on page 145)

Reseller Staff Member's Privileges

There are the following Reseller Staff Member's privileges:

Application Hosting

- Application Users (on page 41)
- APS Packages (on page 42)
- Web Applications Management (on page 199)
- Backups Management (on page 44)
- Own Applications (on page 131)

Dedicated Hosting

Customer Dedicated Servers (on page 61)

Linux Mail Hosting

- AntiSpam Management (on page 39)
- AntiVirus Management (on page 40)
- E-Mail Administration (on page 72)
- Maillists (on page 111)
- Backups Management (on page 44)

Linux Shared Hosting

- Crontabs Management (on page 55)
- Databases Management (on page 64)
- Logfiles Access (on page 109)
- Own Websites (on page 155)
- Scheduled Applications Management (on page 171)
- SiteBuilder
- Content Management Systems (on page 50)

- Web Statistics Access (on page 202)

- Website Administration (on page 204)

- Websites (on page 208)

- Webspace Access (on page 208)

- Backups Management (on page 44)

Windows Shared Hosting

- Databases Management (on page 64)

- ODBC DSN Management (on page 118)

- Own Websites (on page 155)

- Customer Account can be created or removed.

- Customer Account can be made enabled or disabled.

On the **SELECTED_RESELLER_ACCOUNT** > **Accounts** tab > **Customers** subtab screen:

- List of Customer Accounts is displayed. This list contains all child Customer Accounts of the selected Reseller Account.

- Customer Accounts' properties are displayed.

- Customer Accounts' properties can be modified.

- Customer Account can be created or removed.

- Customer Account can be made enabled or disabled.

Customer Control Panel

Not applicable.

Notes:

1. Provider/Reseller Account can be an owner of the subordinated Reseller/Customer Accounts. These Reseller/Customer Accounts are *direct child Accounts* of the Provider/Reseller Account. For example, the **HostingCompany** Provider Account owns the **ResellerLevel1** and **CustomerLevel1** Accounts. The **ResellerLevel1** and **CustomerLevel1** Accounts are the direct child Accounts of the **HostingCompany** Provider Account. The **ResellerLevel1** Account is the direct child Reseller Account of the **HostingCompany** Provider Account. The **CustomerLevel1** Account is the direct child Customer Account of the **HostingCompany** Provider Account.

In turn, the Reseller Account can be an owner of the subordinated Reseller/Customer Accounts, which are *indirect child Accounts* of the top-level Provider/Reseller Accounts. For example, the **ResellerLevel1** Account owns the **ResellerLevel2** and **CustomerLevel2** Accounts. In this case, the **ResellerLevel2** and **CustomerLevel2** Accounts are the indirect child Accounts of the **HostingCompany** Provider Account. The **ResellerLevel2** Account is the indirect child Reseller Account of the **HostingCompany** Provider Account. The **CustomerLevel2** Account is the indirect child Customer Account of the **HostingCompany** Provider Account.

2. The **View accounts** and **View all accounts** operations are the 'system' operations, which are used for internal purposes only.

Customer Directory Integration Administration

This privilege controls the following operations with Customer Active Directory Synchronization Service:

Operation Name / Privilege State	Disabled	View	Manage	Admin

- Session properties are displayed.

Customer Directory Integration Synchronization

This privilege controls the following operations with Customer Active Directory Synchronization Service:

Operation Name / Privilege State	Disabled	Enabled
N/A	Disabled	Enabled

Provider Control Panel, Reseller Control Panel, and Customer Control Panel

Not applicable.

It is a system privilege that controls the ability to perform synchronization. POA automatically manages this privilege.

> **Note:** POA Synchronization Agent performs synchronization under credentials of a system Staff Member, which is created/removed when Customer Active Directory Synchronization Service is activated/deactivated. When POA Synchronization Agent tries to initiate the synchronization process, POA validates the following: 1. credentials of the Staff Member; 2. this Staff Member has the enabled **Customer Directory Integration Synchronization** privilege; If these conditions are not satisfied, the synchronization process fails.

Customer Dedicated Servers

This privilege controls the following operations with Customer Dedicated Servers:

Operation Name / Privilege State	Disabled	View	Edit	Add/Remove
Add/remove Dedicated Servers	Disabled	Disabled	Disabled	Enabled
Edit Dedicated Servers	Disabled	Disabled	Enabled	Enabled
View Dedicated Servers	Disabled	Enabled	Enabled	Enabled

Provider Control Panel and Reseller Control Panel

Not applicable.

Customer Control Panel

- Reseller Accounts' properties are displayed.

- Reseller Accounts' properties can be modified.

- Reseller Account can be created or removed.

- Reseller Account can be made enabled or disabled.

Customer Control Panel

Not applicable.

Notes:

1. Provider/Reseller Account can be an owner of the subordinated Reseller/Customer Accounts. These Reseller/Customer Accounts are *direct child Accounts* of the Provider/Reseller Account. For example, the **HostingCompany** Provider Account owns the **ResellerLevel1** and **CustomerLevel1** Accounts. The **ResellerLevel1** and **CustomerLevel1** Accounts are the direct child Accounts of the **HostingCompany** Provider Account. The **ResellerLevel1** Account is the direct child Reseller Account of the **HostingCompany** Provider Account. The **CustomerLevel1** Account is the direct child Customer Account of the **HostingCompany** Provider Account.

In turn, the Reseller Account can be an owner of the subordinated Reseller/Customer Accounts, which are *indirect child Accounts* of the top-level Provider/Reseller Accounts. For example, the **ResellerLevel1** Account owns the **ResellerLevel2** and **CustomerLevel2** Accounts. In this case, the **ResellerLevel2** and **CustomerLevel2** Accounts are the indirect child Accounts of the **HostingCompany** Provider Account. The **ResellerLevel2** Account is the indirect child Reseller Account of the **HostingCompany** Provider Account. The **CustomerLevel2** Account is the indirect child Customer Account of the **HostingCompany** Provider Account.

> 2. The **View accounts** and **View all accounts** operations are the 'system' operations, which are used for internal purposes only.

Resellers CP Access

This privilege controls the ability to log in to Reseller Control Panel of all child Reseller Accounts from Provider/Reseller Control Panel:

Operation Name / Privilege State	Disabled	Enabled
Access to all resellers CP	Disabled	Enabled
